Decorative and sound absorbing solutions in the form of perforated plasterboards

# Discover CREATEX®, CREASON®, a new generation of innovative acoustic and decorative solutions created by SINIAT

Siniat, an expert in drywall and a leader in drywall systems, has created CREATEX and CREASON - a new range of exclusive, innovative decorative and acoustic solutions for walls and ceilings in public and commercial buildings.

- 
- + Decorative range with **an original and unique design** to give **you more creative options**
- 

- 
- + Solutions with **CAPT'AIR® technology** to improve indoor air quality
- 

- 
- + A new, effective and efficient assembly and joint compound system offering the highest quality finish
-

# NEW AESTHETIC PERSPECTIVE

In response to your search for innovative aesthetic concepts expressing your creativity, Siniat has developed **CREATEX / CREASON**: a new collection of sound absorbing and decorative plasterboards that make ceilings an essential element of the design, strongly emphasized in the whole concept of space arrangement.

Within the 3 collections offered in the CREASON and CREATEX ranges, you have a unique variety of designs at your disposal, allowing you to create a modern spatial surface, rhythmic compositions, playing with combinations of variants, depending on acoustic needs of different rooms of public and commercial buildings.

The background features a minimalist design with abstract, light-grey wavy lines that form a large, organic shape resembling a stylized 'M' or a series of overlapping petals. These lines are composed of numerous thin, parallel strokes.

**CREA**TEX**<sup>®</sup>**  
—  
**CREA**SON**<sup>®</sup>**

## EFFECTIVE ACOUSTICS

CREATEX / CREASON is an aesthetic solution that also provides excellent acoustic and sound absorption properties.

CREATEX / CREASON perforated plasterboards especially designed for public and commercial buildings are **certified by an independent laboratory and meet the highest levels of acoustic absorption requirements (up to max.  $\alpha_w = 0.85$ )**. In classrooms, restaurants or conference rooms, excessive noise and discomfort compromise concentration, conversations and listening efficiency.

Owing to our industry knowledge, Siniat offers internal decoration solutions suitable for all types of buildings, whether new or renovated.

CRE<sup>A</sup>SON®

## AIR QUALITY

Siniat, an expert in drywall construction, proactively working towards sustainable development, well-being and health, has developed **active CAPT'AIR® technology** for all boards in the CREATEX/CREASON range.

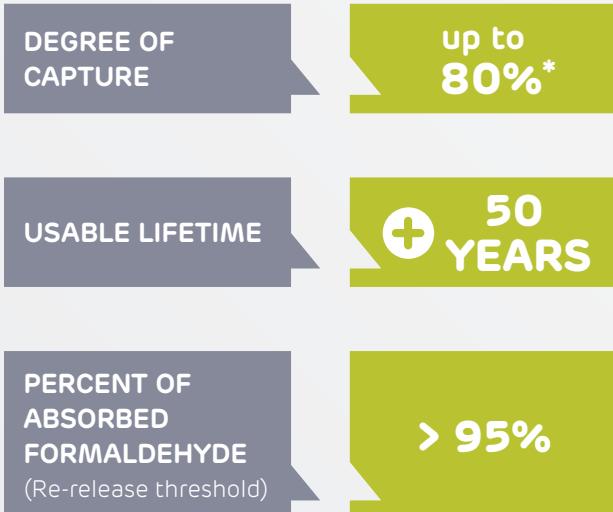

Effectiveness of this **innovative solution, which captures and transforms formaldehydes into neutral compounds**, has been **measured and proven in independent, extensive scientific research** and confirmed in laboratory conditions.

It allows us nowadays to offer solutions suited to all public or residential building designs.

# CREATEX® / CREASON®: CAPT'AIR® SOLUTIONS, ACTIVE SINIAT TECHNOLOGY TO IMPROVE INDOOR AIR QUALITY

CAPT'AIR® boards, consisting of a specially composed plaster core, absorb up to 80%\* of formaldehydes, transforming them into neutral, inert compounds, preventing their re-emission to air. Traditional plasterboards have very low absorption performance and do not have any properties allowing them to remove captured volatile organic compounds.

## EFFECTIVENESS VERIFIED DURING 4 YEARS OF RESEARCH

Opinion of a Siniat expert, Mickael Jahan, certification and testing manager:

«The patented CAPT'AIR® technology, aimed at improving indoor air quality, is the result of Siniat's research. In order to demonstrate its effectiveness, Siniat conducted **3 studies between 2013 and 2017**. Two studies were conducted in real-life conditions. Development of reports, monitoring of experiments and interpretation of results was entrusted to an **independent expert - dr. Fabien Squinazi, former director of the hygiene laboratory of the city of Paris**. The third study was performed by an independent Wessling laboratory and involved standardized tests and analysis of the rate of neutralization of absorbed formaldehyde. After several years of monitoring and recording results, **Siniat has become an expert on this market.**»

\* Value obtained using CAPT'AIR® solutions in wall and ceiling applications

## AIR QUALITY IN ROOMS IN PUBLIC BUILDINGS, NEW SOLUTION FOR MONITORING AND OPERATION 2018-2023

For example, the law on obligations towards the environment introduced in France requires monitoring of indoor air quality in some public facilities hosting sensitive persons, including educational facilities.

The law has been entering into force gradually and the monitoring should be implemented before:

- > **January 1, 2018** for institutions intended for groups of children under six years of age, nurseries and primary schools;
- > **January 1, 2020** for recreation centers and school or second degree vocational education establishments (middle schools, high schools, etc.);
- > **January 1, 2023** for other facilities, including water sports centers, such as swimming pools, spas, aquaparks.

Similar guidelines are already being proceeded in EU states.

From now on, choosing CAPT'AIR® allows you to reduce the risk of non-compliance of public buildings with law and be ahead of the regulation evolution in the medium-term perspective.

**CRE<sub>A</sub>TEX®**  
—  
**CRE<sub>A</sub>SON®**

# ENVIRONMENT AND SUSTAINABLE DEVELOPMENT

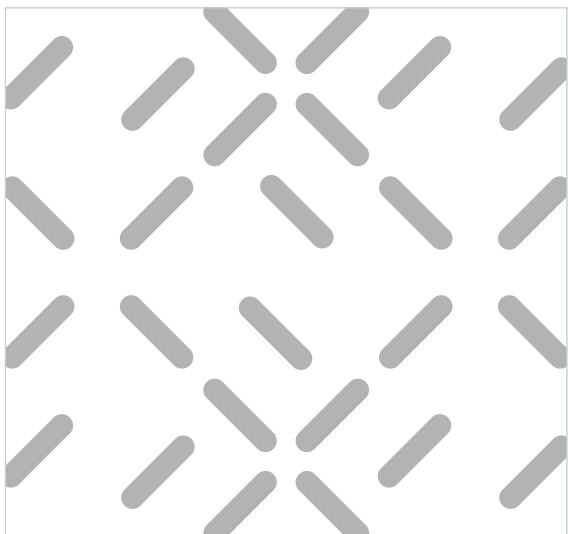

Environmental certificates for buildings are voluntary steps, which allow assessment, according to various reference points, of environmental impact of a construction or reconstruction project. The most common environmental certificates are: **HQE®** (French), **BREEAM® International** (English) and **LEED® International** (American). **CREATEX/CREASON perforated plasterboards** perfectly fit into the environmental certification procedures and allow obtaining additional points during audits as part of multi-criteria assessment of newly constructed buildings. Details can be found in the Eco-sheets prepared by Siniat.

## CRE<sup>+</sup>TEX® Range

Ceiling and wall panels  
with **edge-to-edge  
perforation** without  
visible joints.

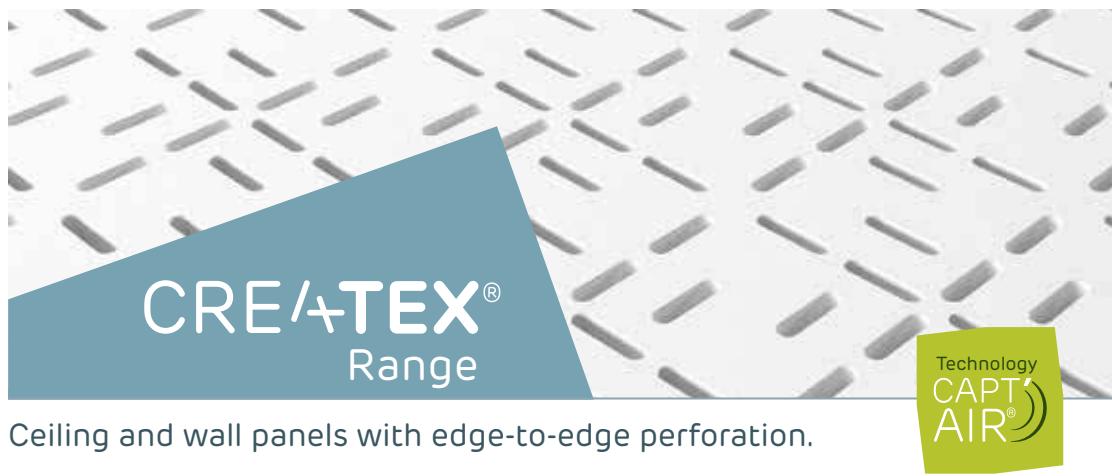

15 modern perforation  
patterns, including 9 original  
Siniat patterns for more  
creativity.

## CRE<sup>+</sup>SON® Range

Ceiling and wall panels  
with **modular perforation**.

5 elegant styles, with refined  
designs for ceilings and walls  
of public and commercial  
buildings.

#### ► APPLICATION

- Perforated plasterboards, 12.5 mm thick, with V-edges, covered at the back with absorbing membrane to meet the acoustic requirements for public and commercial buildings.
- CREATEX multiplies creative possibilities of decorating modern walls and ceilings in new and refurbished projects alike.

#### ► FEATURES AND PARAMETERS

NEW

Size: 1200 x 2000 mm

NEW Edges: V-tapered on all 4 sides

Bottom membrane: white or black interlining fleece

NEW

Reaction to fire class: A2-s1, d0

NEW

NEW Assembly: Siniat steel substructure based on CD60 and UD27 profiles, Siniat Mix joint compound

NEW CAPT'AIR technology

Compliant with EN 14190

#### ► HELIX COLLECTION, available only in Siniat

## Infinity collection

Wall and ceiling panels made of Createx boards blend in perfectly with elements of interior architecture giving endless design possibilities. After installation, the boards form a perfectly smooth and seamless surface with no visible joints. The boards can be combined on one surface with modular suspended ceilings. In combination with perforated boards, standard plasterboards create exceptional, eye-catching effects.

## Installation of CREA<sup>+</sup>TEX / CREASON boards

### PANEL ARRANGEMENT AND LAYOUT

After installation, CREASON / CREA<sup>+</sup>TEX perforated panels create a homogeneous surface with attractive aesthetics and excellent acoustic properties. Depending on the board perforation system - edge-to-edge or modular - we may obtain original decorative effects. Start the panel installation in the middle of the room according to the following drawing. The CREASON / CREA<sup>+</sup>TEX panel arrangement should be planned so that longitudinal edges of the boards are parallel to the direction of sunlight.

### PANEL CUTTING

CREASON / CREA<sup>+</sup>TEX boards should be cut with a knife. When trimming, the board should lie on a flat surface. Using a knife guided by the liner, we cut the interlining along with cardboard and then break the plaster core and cut the cardboard on the face side. Where particularly accurate board cutting is required, using a panel fine-toothed saw designed for cutting plasterboards is recommended. Before using the saw, cut the interlining along the cutting line with a knife.

### FRAME STRUCTURES

The frame structures for ceiling and wall plasterboard panels is identical to that for standard plasterboards. The only difference is smaller spacing of cross profiles - 300 mm. For a ceiling panel system using CREASON / CREA<sup>+</sup>TEX boards, two-level cross frame can be used - which is the recommended system; one-level, single frames or one-level cross frames. Details regarding the installation of both ceiling and wall plasterboard panels are included in the SINIAT technical guides.

### BRACKET AND PROFILE SPACING - TWO-LEVEL CROSS FRAME SYSTEM

A maximum distance between brackets mounted to the Nida CD 60 main profile is 900 mm. The main profiles spacing in the upper layer is max. 1000 mm. Spacing of transverse profiles in the lower layer is max. 300 mm.

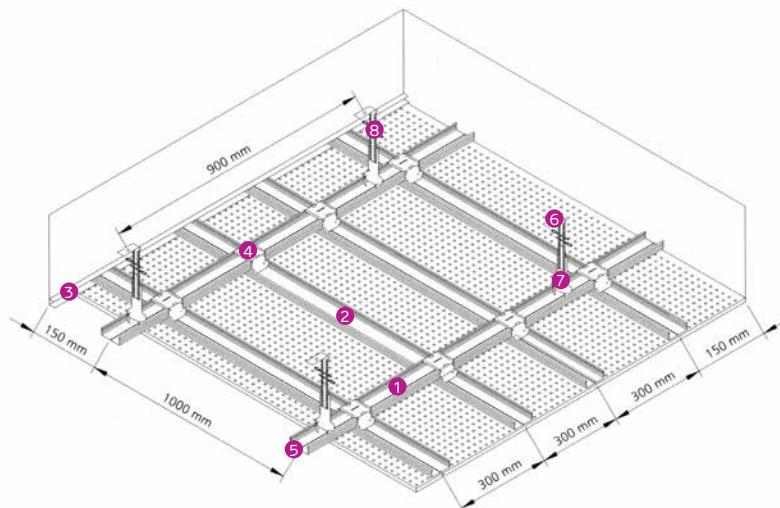

### CHAMFERING PANEL EDGES

Depending on the type, CREASON / CREA<sup>+</sup>TEX boards come in two types of edges. Creason perforated boards have a tapered longitudinal edge and a cut transverse edge. In Createx boards, all edges have a factory-made chamfered V edge - which greatly simplifies jointing; they do not require chamfering. Before fixing of the boards, slightly chamfer all the edges cut on the face side (only in the case of CREASON boards). The chamfered edges should be damped with water to remove any remaining gypsum before applying the joint compound.

## Installation of CREA<sup>+</sup>TEX / CREASON boards

### FIXING THE BOARDS TO THE FRAME STRUCTURE

The method of fixing the CREASON/CREATEX panels to the profile grate is similar as in the case of standard plasterboard. In the case of ceilings, start the installation with a "starter" board in the middle of the ceiling, which will determine location of the other panels. Therefore, the first board must be particularly precisely positioned relative to the room outline. In the case of wall panels, the mounting proceeds in the same manner as in the Nida Lining system. In the case of ceiling panels, the boards should always be fastened with a transverse edge to the bottom grate profiles (longitudinal edge of the board parallel to the main profiles). First fasten the transverse-front edge of the board, then the longitudinal edges. The boards are screwed with 3.5 x 25 mm selftapping screws. Maximum spacing between screws is 170 mm for the ceiling and 250 mm for the wall. Screws should be placed in a distance of at least 10 mm from the longitudinal edges (covered with cardboard) and from the edges of boards not covered with cardboard and the edges of holes of at least 15 mm. Screw the panels perpendicularly to the face of the board deep enough so that the screw head does not pierce the surface of the cardboard and at the same time does not protrude above the face of the board.

### ELEMENTS OF CEILING FRAME STRUCTURE IN TWO-LEVEL CROSS SYSTEM

- ① Main metal profile NIDA Metal CD60
- ② Secondary profile NIDA Metal CD60
- ③ Guide NIDA Metal UD30
- ④ Cross connection bracket CD60
- ⑤ Section connector CD60
- ⑥ Nonius hanger upper or suspension wire
- ⑦ Nonius hanger lower CD60 or hanger CD60
- ⑧ Nonius clamp

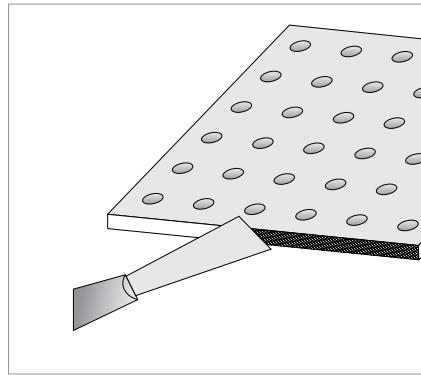

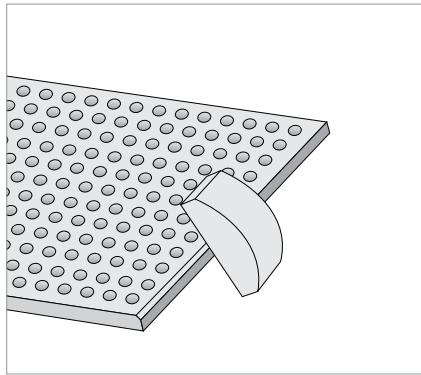

### CREA<sup>+</sup>TEX BOARDS

A joint compound dedicated to CREA<sup>+</sup>TEX boards with V-edge - boards with edge-to-edge perforation is **Siniat Mix**. Fix the boards to the frame as described. Apply Siniat Mix joint compound using cartridge on the joints between the boards. Pay particular attention that the putty does not get into the perforation. When installing CREA<sup>+</sup>TEX boards, a special mounting kit may be helpful. It ensures that correct spacing between the boards is maintained.

## JOINTS IN CREASON BOARDS WITH TAPERED EDGE

---

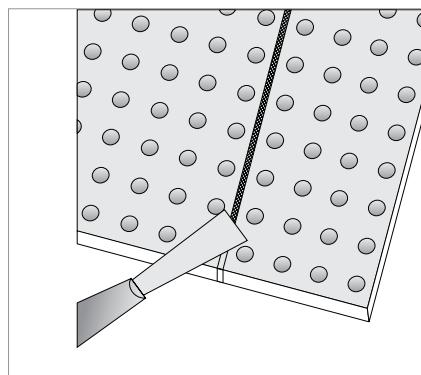

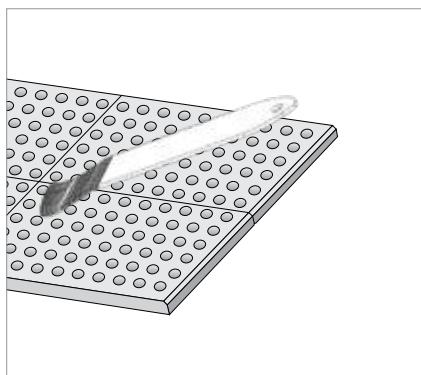

The installation and joint finishing method applicable to CREASON boards with tapered edge - panels with a modular perforation system - is identical to that of standard plasterboards. For joints along longitudinal and transverse edges use reinforcing tape and Nida Profesional gypsum putty. Jointing should start after screwing all boards to the frame. Detailed information on these works is included in the SINIAT gypsum board assembly instructions.

## FINISHING AND SMOOTHING

---

After jointing all joints between the boards and after they have dried, begin smoothing the edges of the boards and screws using Nida Profesional gypsum putty. Any excess of the gypsum putty that got into the perforation holes should only be removed after the gypsum has set. It is also possible to cover the holes with adhesive tape to avoid accidental filling of the perforations during works with putty. After the Nida Profesional putty dries, sand the joints with sandpaper or a sanding mesh. If mineral wool insulation is planned, it should be mounted while fixing the boards to the frame. The wool, preferably glass wool, is laid directly on the board. Do not use vapor barrier or wind insulation between the interlining and a layer of wool because it adversely affects the acoustic properties of the entire system.

## Conditions of use

TO ENSURE HIGH QUALITY OF INSTALLATION WORKS USING THE CREATEX AND CREASON PERFORATED PLASTERBOARDS, FOLLOW THE GUIDELINES PROVIDED IN THIS MANUAL.

Createx and Creason boards are designed for indoor walls and ceilings. Installation works should be carried out at a temperature from +5°C to +40°C and air humidity not exceeding 70% during and after all work in wet technology is completed. Prior to plasterboard mounting, all windows and external doors should be installed in the room. Start finishing and smoothing the boards having checked that the room temperature and humidity is stable and meets the target conditions for the given room. To avoid cracking and deformation of the boards, keep a distance of about 10 mm between the CREASON / CREATEX board and durable structural elements limiting it, such as walls.

## TRANSPORT AND STORAGE

---

Transport individual boards in vertical position, paying particular attention so as not to damage the edges. Boards stacked on a pallet should be transported using dedicated transport trolleys and trucks. The boards should be protected against moisture and any adverse impact of weather. Store the boards on a dry, flat surface on pallets or wooden sleepers with 35 cm spacing. When removing individual boards from pallets, pay attention not to damage the interlining glued to the underside of the board.

REMEMBER TO PROVIDE EXPANSION JOINTS IN PLASTERBOARD SURFACES EXCEEDING 100 M<sup>2</sup> OR OVER 10 M IN LENGTH AND AT THE PLACES OF STRUCTURAL EXPANSION JOINTS.

# Painting of the boards

CREATEX AND CREASON PANELS MAY BE PAINTED WITH ALL PAINTS INTENDED FOR STANDARD PLASTERBOARDS. FOR ATTRACTIVE AND DECORATIVE EFFECT USE COLOR COATING. DO NOT USE MINERAL (CALCIUM, SILICATE, WATER-GLASS) BASED PAINTS. PAINTS CAN BE WHITE OR IN ANY COLOR; ALWAYS FOLLOW INSTRUCTIONS PROVIDED IN PAINTING PRODUCTS TECHNICAL DATA SHEETS DURING PRIMING AND PAINTING.

## PRIMING

Before applying a primer on the CREASON / CREATEX boards, check that the surface of the boards and joints is smooth, dry, stable, without dirt and cracks. If there is such a need, dust from the boards should be removed with a damp cloth, sponge or using an industrial vacuum cleaner. Priming is possible only after putty sets and dries completely. Due to the increased absorption in the area of joints, it is recommended that primer be applied twice, using a roller. Start painting only after the primer has dried completely.

## ROLLER PAINTING

Apply the base coat at least twice, maintaining sufficient intervals between subsequent coats as specified in instructions included in the paint technical data sheet. In the case of dark or intense colors, it may be necessary to apply more layers. In the case of low opacity paints, it is recommended that the primer be colored with a transition colorant between white and the hue chosen for the top coat. Apply the paint using a short pile roller. After dipping the roller into the paint, drain it on a special paint tray. Excess paint from the roller can stain the perforation walls, spoiling the decorative effect, and in extreme cases can diminish the sound absorption properties of the board. Roll the paint over the panels in all directions so as to evenly cover the entire surface. Avoid pressing the roller too strongly, as this may cause excessive paint application. When applying the last layer of the top paint, move the roller in one direction only - perpendicular to the wall which with the source of daylight (e.g. the wall with window).

## SPRAY PAINTING

Painting with the use of spraying technology may reduce the sound absorption coefficient due paint covering the interlining of the internal side of the CREASON / CREATEX panel.

## MAINTENANCE

Maintenance of the boards consists in removing dust with a soft brush or a damp cloth, with water and a mild detergent or diluted soap. When cleaning, avoid wetting the plasterboards. The surface of the panels can be renovated by applying new paint coat.

DURING PRIMING AND PAINTING ALWAYS FOLLOW INSTRUCTIONS PROVIDED IN PAINTING PRODUCTS TECHNICAL DATA SHEETS .
